

transforming the way the world works

Transforming the Way You Work

What's new from Trimble

John Whitehead
APAC Director, Geospatial

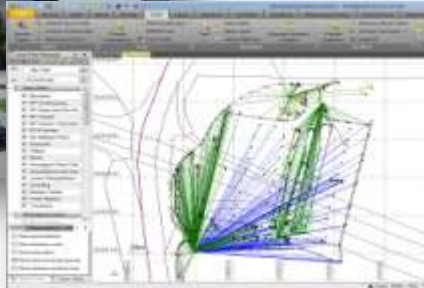

Focus on the Data... that's where the value is!

Big data is a broad term for large or complex data sets where traditional data processing is inadequate. Challenges include analysis, capture, data curating, search, sharing, storage, transfer, visualization, and information privacy.

Wikipedia, Sept 2015

Geospatial challenge: how to effectively extract valuable information from large, often disparate data sets from different origins?

Traditional GNSS/TS

3D Terrestrial Scanning

Mobile Solutions

Unmanned Aerial Solutions

Terrestrial Photogrammetry

Remote Sensing

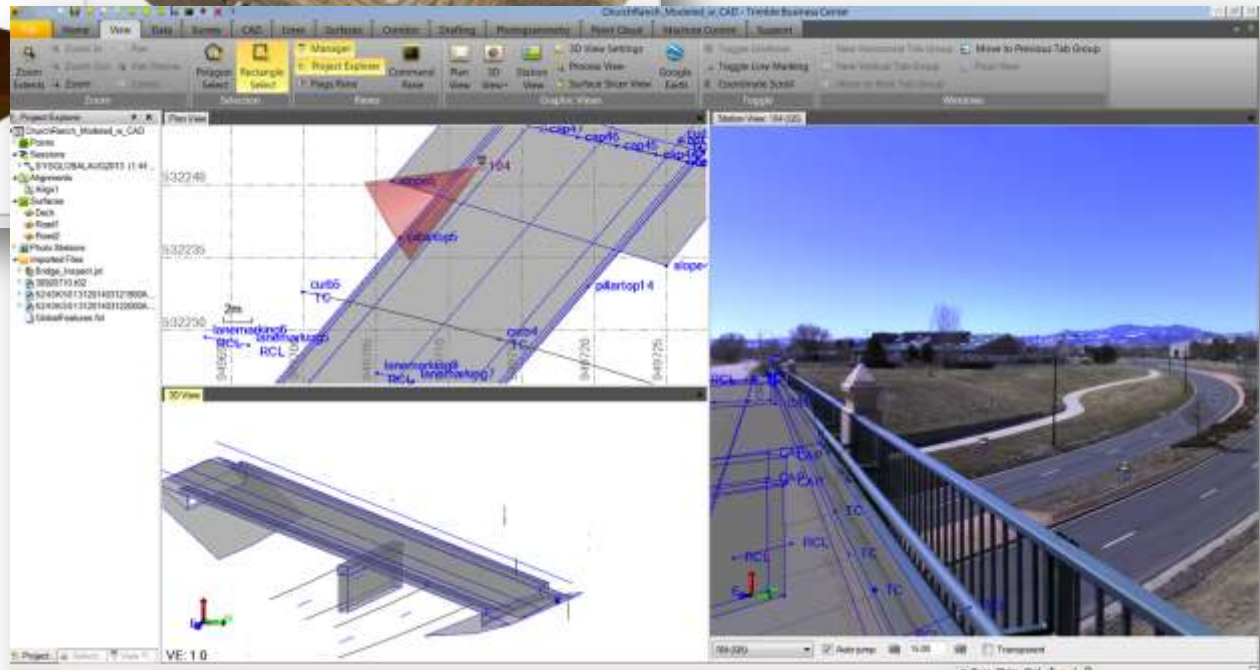

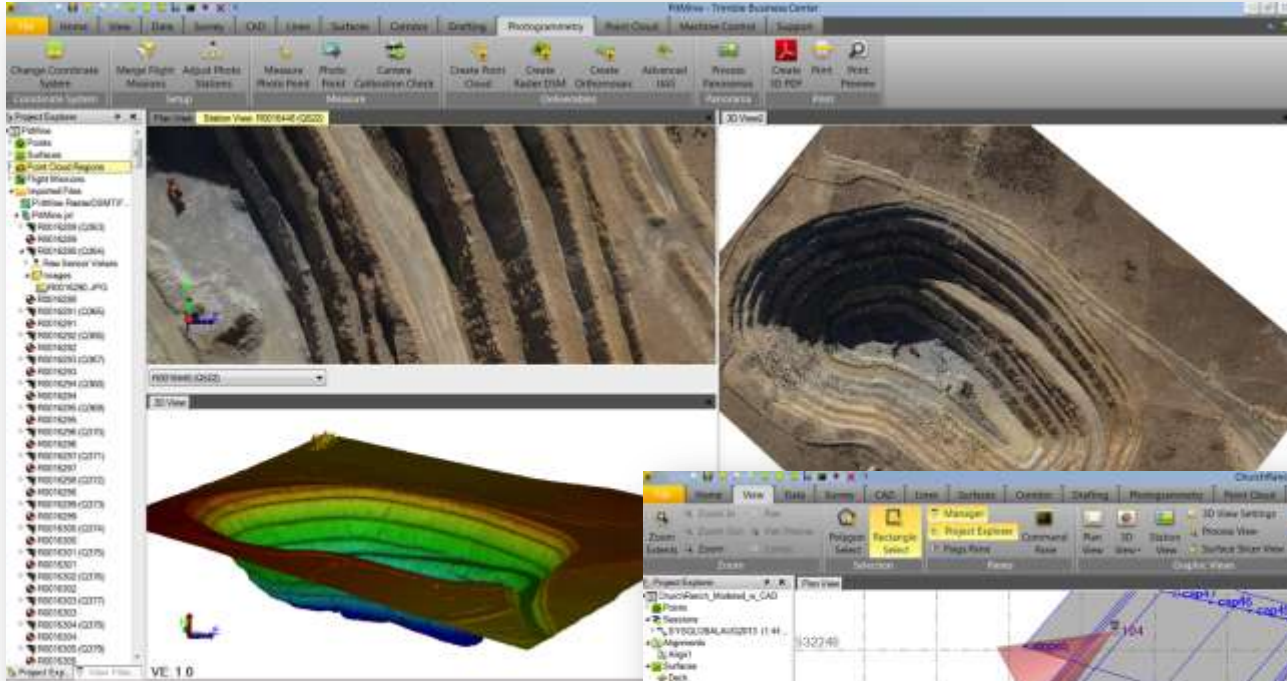

PLUS MANY MORE.....!

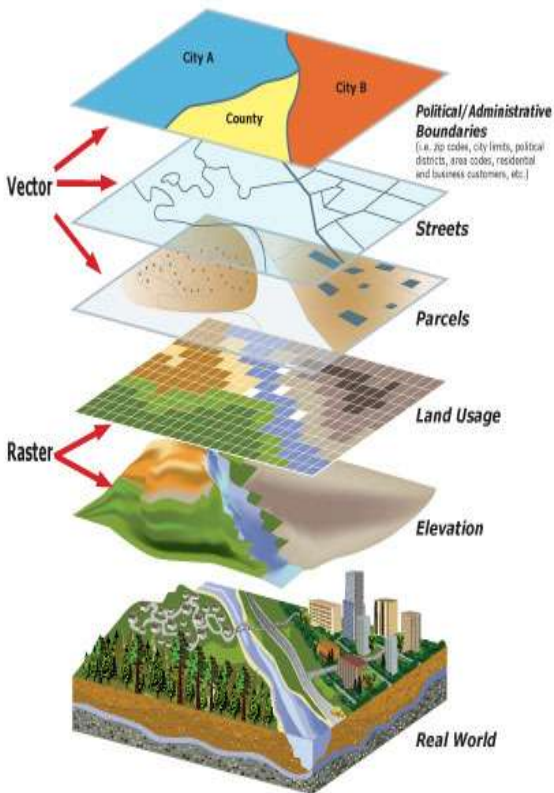

KEY ENABLERS

Data Integration

Data Fusion and Analytics

New Buildings in yellow

Vegetation Clearances –
Power lines

Temporal Changes -
Permitting/Planning

Cloud Computing

Data Access

World of 3D and Collaboration

Trimble Connect Ecosystem

brings together and allows you to manage

People, Information & Equipment

Reduce cost & increase profit through better information management

Eliminate inefficiencies, wastage, & litigations

Bring transparencies, and traceability

Trimble Connect Ecosystem

provides streamlined processes for
Your Projects & Business

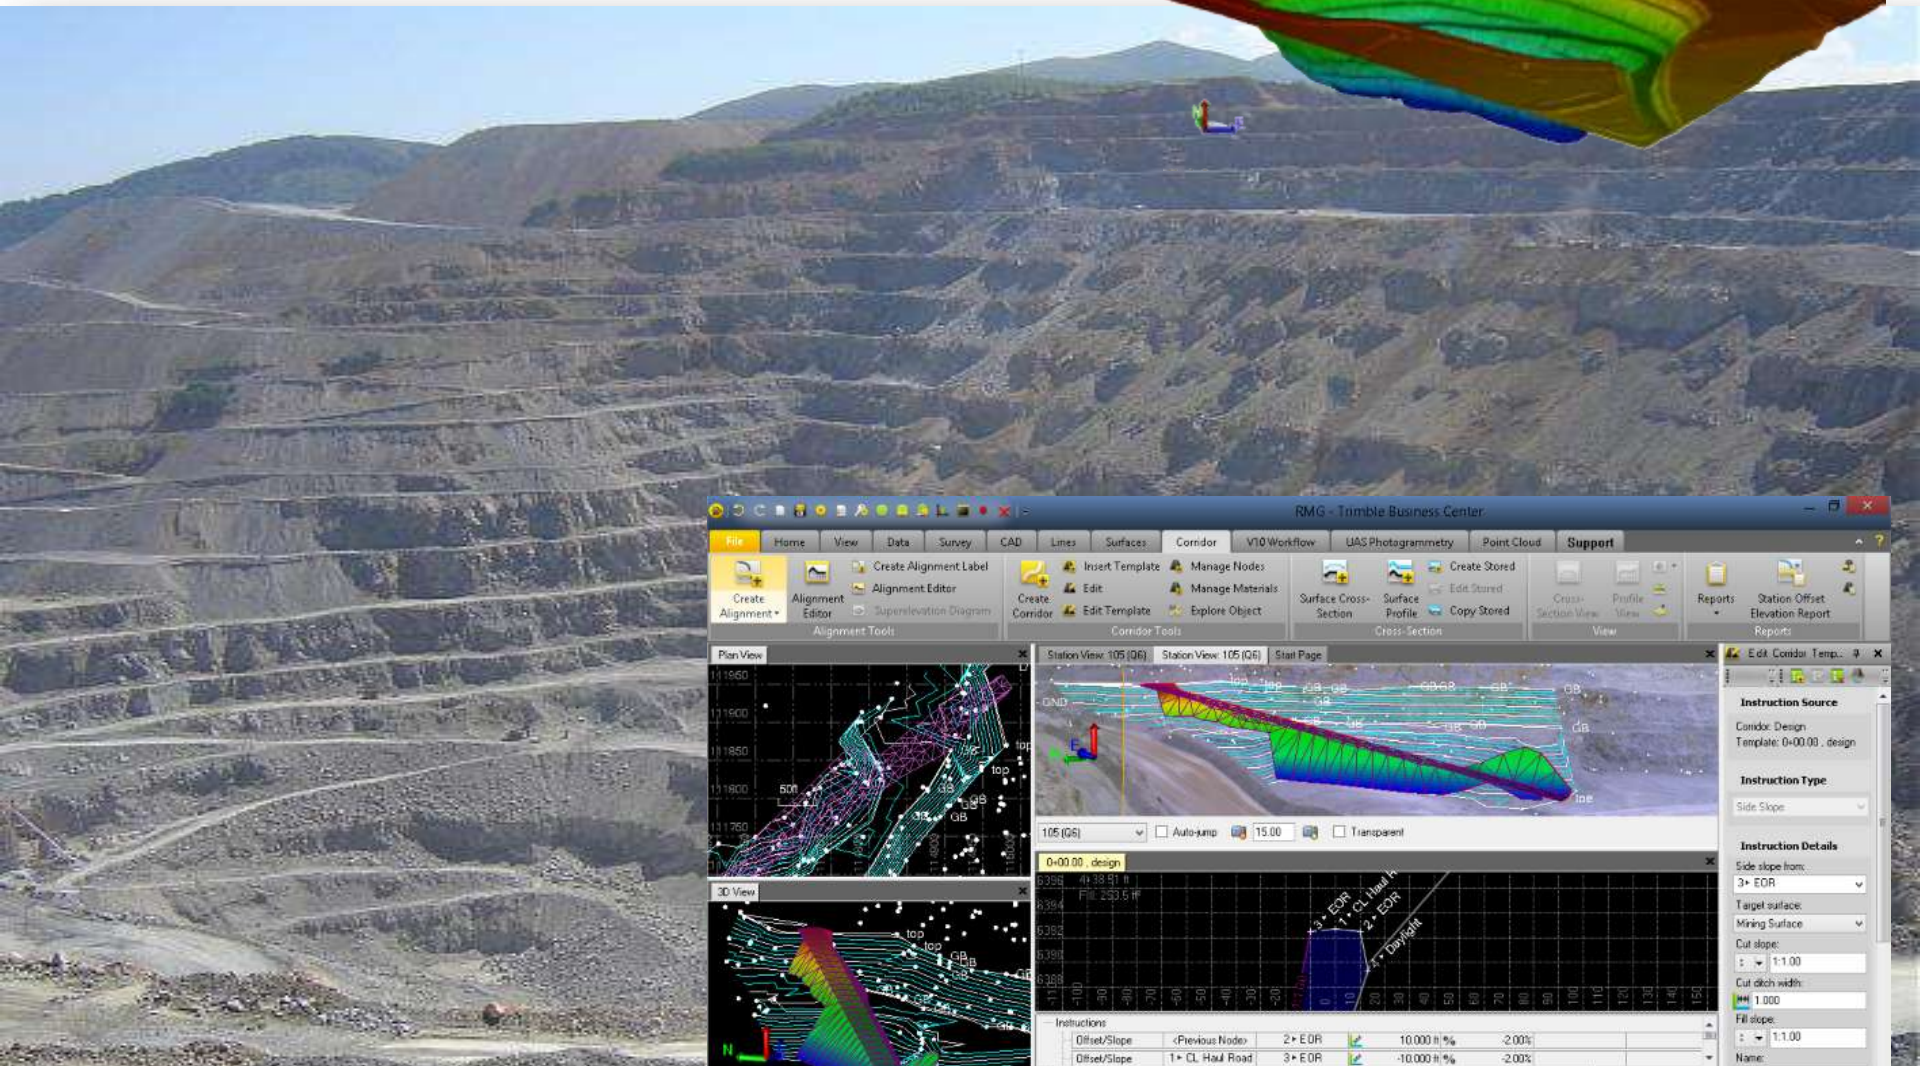

**Brings designers,
contractors and
operators into a
seamlessly integrated
work process.**

**Every stakeholder can
share, review, coordinate**

Anywhere. Anytime.

Asset Capture - Oil and Gas

Inpho Extended CAD Capabilities

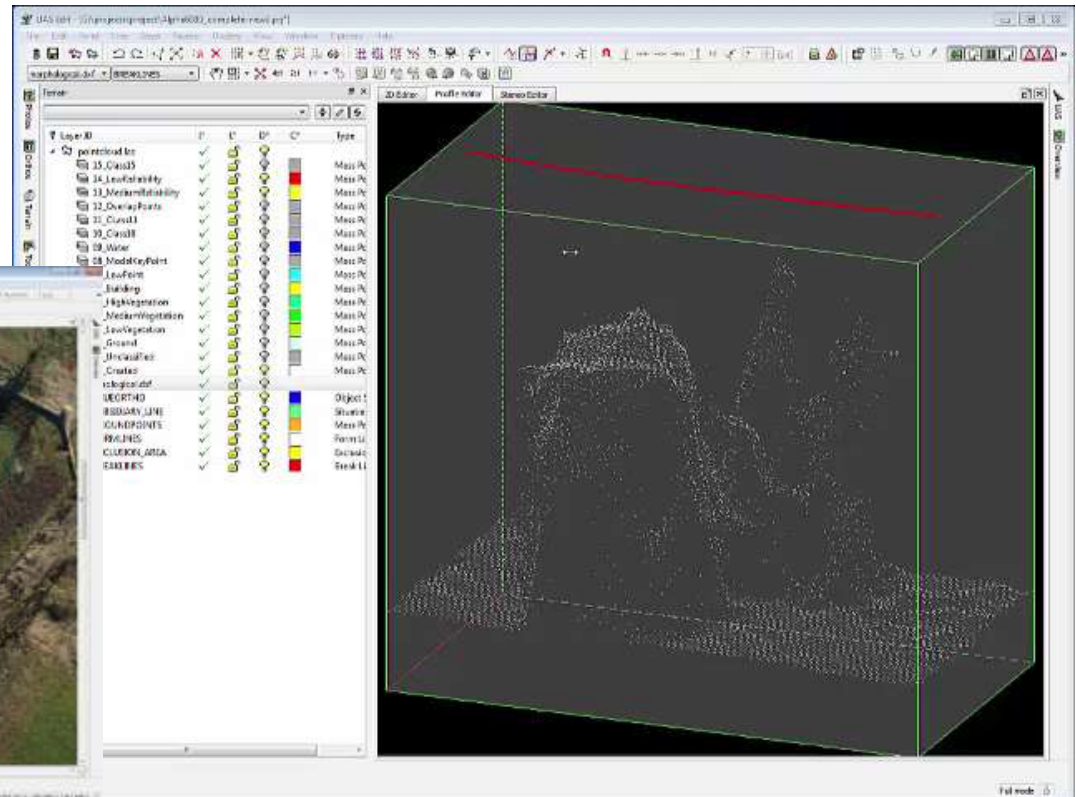

Follow Terrain Mode for linework

- Digitize in xyz without setting the height manually
- Repeatable accurate measurements based on image matching or interpolation

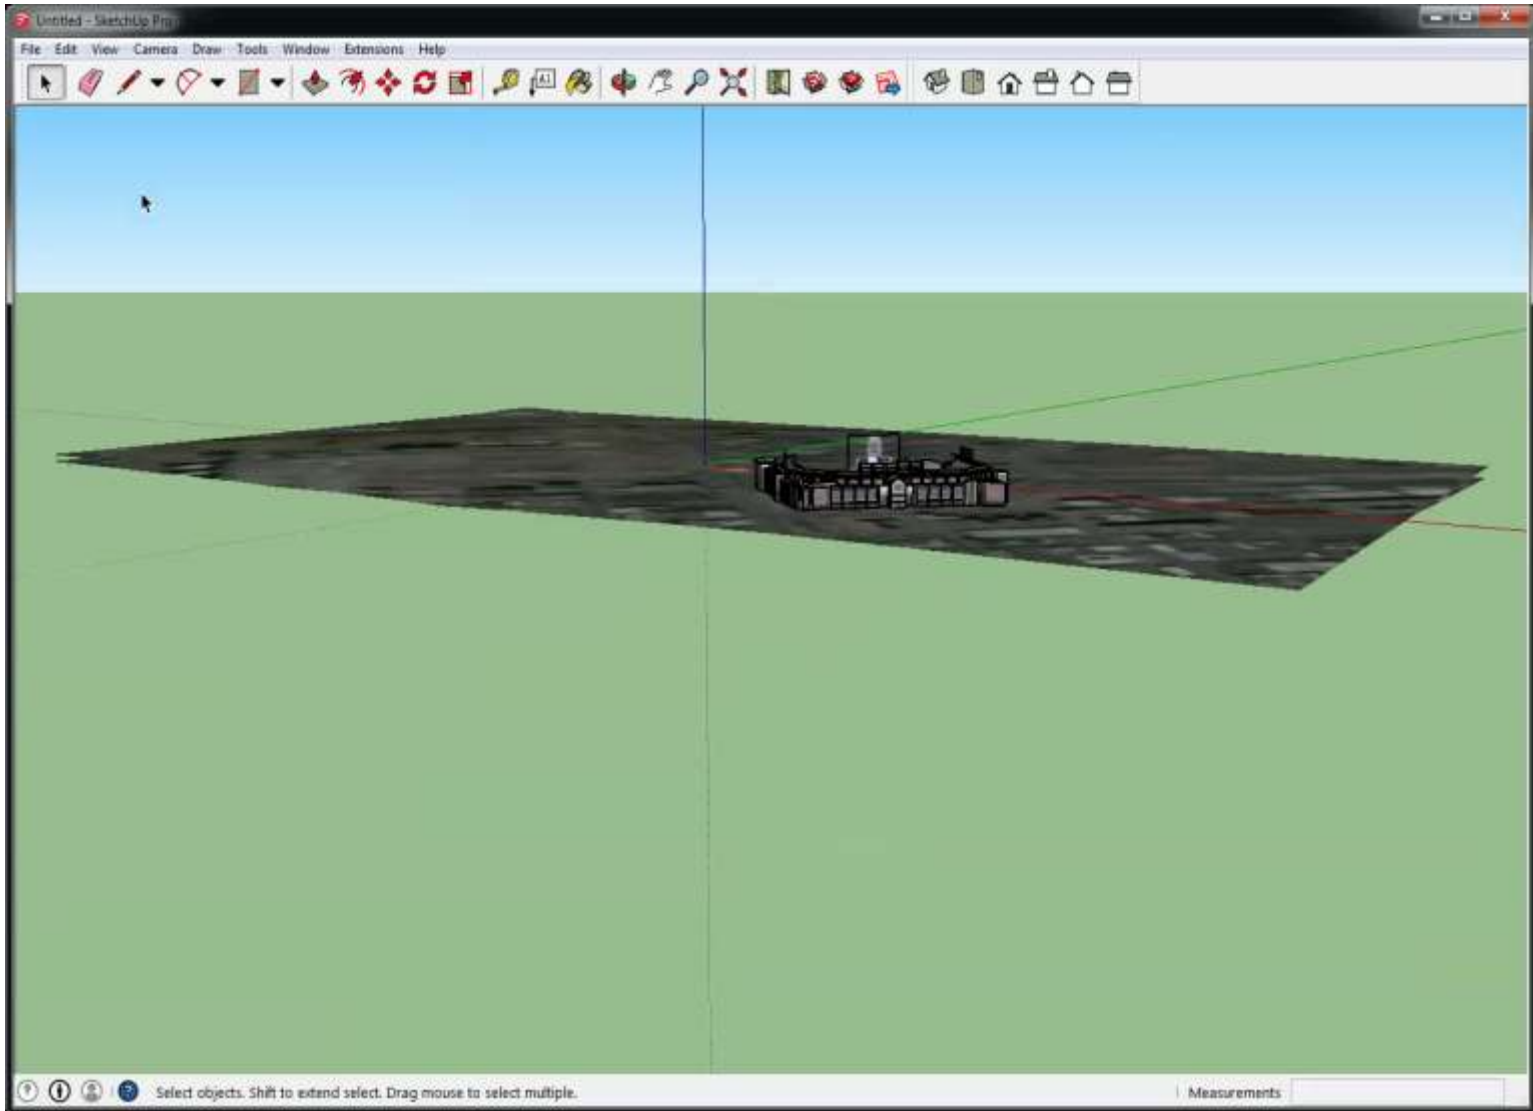

Rematch data to terrain

- Drape 2D data or incorrect drawings to the UAS data

No stereoscopic expertise needed

Data Integration – Visualization

Urban Canopy Analysis

- **Boulder County, CO, USA**
- **Rockefeller Foundation's 100 Resilient Cities (100RC)**
- **Data Fusion - eCognition**
 - Remote Sensing imagery
 - Aerial LiDAR and imagery
 - GIS Ground truth
- **Information Extraction**
 - Urban canopy footprint
 - Tree type / damage and health assessment
 - Heat and Energy usage assessment

Presserving Machu Pichu

- Flying height above ground ~100m
- Challenging conditions (altitude/weather)
- 1st day: flight > processing over night

Data: Distribution Partner Geosystems & Ministry of Culture

Summary

- **Rapidly expanding sources for rich geospatial data**
- **Geospatial Professionals have the knowledge of how to integrate and link the right data to generate valuable information and results for clients**
- **Data access, integration, collaboration and extraction are critical to turn big data into actionable information**

Finish with a telling quote:

“We quantify and eliminate geospatial unknowns by telling people (and companies) what they have and where it is. The ability to give an entire project team a geo-referenced 360-degree view is an incredible tool. It’s important not just for engineers but for other disciplines inside the project as well. We do a lot of long-line pipelines where we work with archeologists, planners, engineers and biologists.”

- Jason Jung, CH2M
